## Sage:

- 1 Word entered to the email field of a \*chan (iichan, 4chan, 2chan, etc) message board so that the post is not bumped. It is Japanese for 'to lower.' It is the opposite of 'age' (ah-gay), which means to raise.
- 2 An antiquated word meaning a man of deep mind or wisdom, carrying the capacity to give advisement within more typically the management of life or spiritual and self-realizing matters.
- 3 A large massive blemish, boil or pimple; found on the top of one's nose.  
"holy crap, i got the biggest sage on my nose, and prom is tomorrow!"
- 4 Originating from the slang 'safe' and used in the same context.  
A: "Can I borrow your coat?"  
B: "Yeah"  
A: "Sage."
- 5 A scammer, thief, stealer. . . .

<http://www.sagemath.org>

## Sage

is a free open-source mathematics software system licensed under the GPL. It combines the power of many existing open-source packages into a common Python-based interface.

**Mission:** Creating a viable free open source alternative to Magma, Maple, Mathematica and Matlab.

... I will stick to this definition.

# Why? I

## “Neubüser’s Law”

“You can read [some] Theorem and its proof in [some] book in the library [...] then you can use [that] Theorem for the rest of your life free of charge, but for many computer algebra systems license fees have to be paid regularly [...]. You press buttons and you get answers in the same way as you get the bright pictures from your television set but you cannot control how they were made in either case.

With this situation **two of the most basic rules of conduct in mathematics are violated**: In mathematics **information is passed on free of charge** and **everything is laid open for checking**. Not applying these rules to computer algebra systems that are made for mathematical research [...] means **moving in a most undesirable direction**. Most important: Can we expect somebody to believe a result of a program that he is not allowed to see? Moreover: Do we really want to charge colleagues in Moldava several years of their salary for a computer algebra system?” – J. Neubüser (1993) (he started GAP in 1986).

**Mathematica** is a complete technical computing environment that seamlessly integrates numeric and symbolic computations, interactive document capabilities, an advanced programming language, and powerful connectivity.

The current version, *Mathematica* 6, introduces dynamic interactivity,

# Why? III

## “Why You Do Not Usually Need to Know about Internals”

“Particularly in more advanced applications of **Mathematica**, it may sometimes seem worthwhile to try to analyze internal algorithms in order to predict which way of doing a given computation will be the most efficient. And there are indeed occasionally major improvements that you will be able to make in specific computations as a result of such analyses.

But most often the **analyses will not be worthwhile**. For the internals of **Mathematica** are **quite complicated**, and even given a basic description of the algorithm used for a particular purpose, it is usually **extremely difficult** to reach a reliable conclusion about how the detailed implementation of this algorithm will actually behave in particular circumstances.

– Mathematica Tutorial (2008)

# Mission Statement

## Mess with the Best

Provide an open source, high-quality, and free viable alternative to **Magma**, **Mathematica**, **Maple** and **MATLAB**.

In other words: create a unified mathematics software package for algebra, calculus, elementary to very advanced number theory, cryptography, numerical computation, commutative algebra, group theory, combinatorics, graph theory, exact linear algebra and more.

To achieve this do not reinvent the wheel but **reuse** as much **existing building blocks** as possible and make sure the result is **rigorously tested**, **easy to modify** by the end user and **very well documented**.

Also create a **helpful environment** for users to get help (mailinglists, irc-channel, meetings, coding sprints).

# What is Sage?

**Sage** is a mathematics software package developed by a **worldwide** community of developers.

- 1 a **distribution** of the best free, open-source mathematics software available that is easy to compile or install from binaries,
- 2 an **interface** to most free and commercial mathematics software packages,
- 3 a **new library**, which uniformly covers the widest area of **functionality**, including several new implementations not yet found elsewhere.

5 Trivia

# Python & Cython

**Sage** does not come with yet-another ad-hoc math language, it uses **Python** instead.

- one of the most widely used programming languages (Google, IML, YouTube, NASA),
- easy for you to define your own data types and methods on it (bitstreams, ciphers, rings, whatever),
- Very clean language that results in easy to read code,
- a **huge number of libraries**: statistics, networking, databases, bioinformatic, physics, video games, 3d graphics, numerical computation (scipy), and serious “pure” mathematics (via Sage)
- easy to use existing C/C++ libraries from Python (via **Cython**)

# Python Example: Databases

On 11/1/07, Jack <XXXX.XXXXXXXXXX@XXXXX.XXX> wrote:

```
> Is it possible to fetch information from a database (say, PostgreSQL)
> with sage? If so, how is it done? If not, is there a workaround
> that people use?
```

Using Psycopg2 is the most popular way of using PostgreSQL from python,

see:

<http://www.initd.org/tracker/psycopg/wiki/PsycopgTwo>

...

**SQLAlchemy** is the Python SQL toolkit and Object Relational Mapper that gives application developers the full power and flexibility of SQL. It provides a full suite of well known enterprise-level persistence patterns, designed for efficient and high-performing database access, adapted into a simple and Pythonic domain language.

# Python Example: Pen-Testing

**Scapy** is a powerful interactive packet manipulation program written in Python. It is able to forge or decode packets of a wide number of protocols, send them on the wire, capture them, match requests and replies, and much more. It can easily handle most classical tasks like scanning, tracerouting, probing, unit tests, attacks or network discovery (it can replace hping, 85% of nmap, arp spoof, arp-sk, arping, tcpdump, tethereal, p0f, etc.).

```
sage: from scapy import rdpcap, TCP, IP
sage: packets = [p[IP] for p in rdpcap("/home/malb/example.pcap") \
                  if p[TCP] and len(p[TCP]) > 32]
...
sage: def get_uint(pl, length):
...

sage: p_length, pl = get_uint(pl, 4)
sage: p, pl = get_uint(pl, p_length)
sage: g_length, pl = get_uint(pl, 4)
sage: g, pl = get_uint(pl, g_length)
sage: Zp = GF(p)
sage: g = Zp(g)
sage: e = g**ZZ.random_element(0,p)
sage: e.log(g) # yeah, right ;-)
```

# Cython

```

from sage.misc.misc import cputime
cdef extern from "math.h":
    cdef float sinf_c "sinf"(float x)

def sinf(x):
    return sinf_c(x)

def timesinf(x):
    cdef int i
    cdef float _x = float(x)
    t = cputime()
    for i from 0 <= i < 1000000:
        _ = sinf_c(_x)
    return cputime(t)

sage: sinf(1.0), sin(1.0)
(0.841470984807897, 0.84147101640701294)
sage: %timeit sinf(1.0)
625 loops, best of 3: 3.55 micro seconds per loop
sage: %timeit sin(1.0)
625 loops, best of 3: 12.3 micro seconds per loop
sage: timesinf(1.0)
0.00799899999999998673

```

# Symmetric Multiprocessing (SMP)

Often, parallel computing is hard. But it is quite easy for coarse grained embarrassingly (proudly) parallel problems:

```
sage: @parallel(2)
sage: def f(n):
...     return factor(n)
sage: %time _ = [f(2^217-1), f(2^217-1)]
CPU time: 2.05 s, Wall time: 2.08 s
sage: %time _ = list( f([2^217-1, 2^217-1]) )
CPU time: 0.01 s, Wall time: 1.11 s
sage: 1.11/2.08
0.533653846153846
```

## For Grid computing

...try DSage or iPython.

## 2.5.1 Dirichlet Characters

A *Dirichlet character* is the extension of a homomorphism  $(\mathbf{Z}/N\mathbf{Z})^* \rightarrow R^*$ , for some ring  $R$ , to the map  $\mathbf{Z} \rightarrow R$  obtained by sending those  $x \in \mathbf{Z}$  with  $\gcd(N, x) > 1$  to 0.

```
G = DirichletGroup(21)
list(G)

[[1, 1], [-1, 1], [1, zeta6], [-1, zeta6], [1, zeta6 - 1],
[-1, zeta6 - 1], [1, -1], [-1, -1], [1, -zeta6], [-1, -zeta6],
[1, -zeta6 + 1], [-1, -zeta6 + 1]]

G.gens()

[[-1, 1], [1, zeta6]]

len(G)

12
```

Having created the group, we next create an element and compute with it.

Done

- graphical user interface
- 2D plotting
- interactive 3D plotting
- $\text{\LaTeX}$  typesetting
- web service (AJAX, SSL) inspired by Google Docs
- worksheet sharing
- worksheet up-/download

# GUI for Many Mathematics Packages

```

a:=1;
for(i=1,100, if(isprime(i), a+=1, a+=2));
a

176

%singular
int a = 1; int i = 1;
for(i=1; i<=100; i=i+1) { if(prime(i) == i) { a=a+1; } else { a=a+2; } };
a;

176

%magma
a:=1;
for i in [1..100] do if isPrime(i) then a:=a+1; else a:=a+2; end if; end for;
a;

176

%gap
a := 1;
for i in [1..100] do if isPrime(i) then a:=a+1; else a:=a+2; fi; od;
a;
```

Examples:

- Pari
- Maxima
- Singular
- Gap
- Mathematica
- Maple
- ...

# A Distribution I

Arithmetic	<b>GMP, MPFR, Givaro, MPFI</b>
Commutative Algebra	<b>PolyBoRi, SINGULAR (libSINGULAR)</b>
Linear Algebra	<b>LinBox, M4RI, IML, fpLLL</b>
Cryptosystems	<b>GnuTLS, PyCrypto</b>
Integer Factorization	<b>FlintQS, ECM</b>
Group Theory	<b>GAP</b>
Combinatorics	<b>Symmetrica, sage-combinat</b>
Graph Theory	<b>NetworkX</b>
Number Theory	<b>PARI, NTL, Flint, mwrnk, eclib</b>
Numerical Computation	<b>GSL, Numpy, Scipy, ATLAS</b>
Calculus, Symbolic Comp.	<b>Maxima, Sympy, Pynac</b>
Statistics	<b>R</b>
User Interface	Sage Notebook, <b>jsmath, Moin wiki, IPython</b>
Graphics	<b>Matplotlib, Tachyon, libgd, JMol</b>
Networking	<b>Twisted</b>
Databases	<b>ZODB, SQLite, SQLAlchemy</b> , Python pickle
Programming Language	<b>Python, Cython</b> (compiled)

Overall more than 70 packages are included and shipped with **Sage**.

## A Distribution II

Packages

Languages

Overall **very** roughly 4.5 million lines of source code and estimated several hundred person-years.

# A Unified Interface

- **Sage** interfaces to: Axiom, GAP, GP/PARI, Kash, Macaulay2, Magma, Maple, Mathematica, MATLAB, Maxima, MuPad, Octave, Singular, ....
- This gives **Sage** a wide range of functionality.

Example:

```
sage: x = gp('9+6') # the GP/PARI math software
```

This fires up one copy of GP/PARI and sends the line 'sage[1] = 9+6' to it

```
sage: x, x.name()
15, 'sage[1]'
sage: x.factor()
[3, 1; 5, 1]
```

Another Example:

```
sage: l.groebner_basis() # Singular
```

# Getting Started With Sage

## Ways to use Sage:

- download source; type 'make', wait, run (Linux, OSX, Solaris (soon))
- download binaries for a wide range of platforms
- download VMWare image (e.g. for Windows)
- try it online: <http://www.sagenb.org>

## Documentation:

- **Sage** installation guide
- interactive tutorial
- comprehensive reference manual
- “How Do I Construct ...” manual
- **Sage** developer's guide
- <http://wiki.sagemath.org>
- sage-support mailing list
