SAGE-COMBINAT Combinatorial Species

# SAGE-COMBINAT

副下 《臣下 《臣

# My Involvement with Sage

- ▶ I first heard about Sage at Sage Days 3 in February 2007.
- I had already written a fair amount of Python code for the combinatorics of the representation theory of the symmetric group.
- ► I found that MUPAD-COMBINAT already had much of the functionality that I was interested in.

# MUPAD-COMBINAT

- Open source library for algebraic combinatorics built on top of MuPAD.
- Its main purpose is to provide an extensible toolbox for computer exploration, and foster code sharing between researchers in this area.
- Started in 2000 by Nicolas Thiéry and Florent Hivert.
- Many contributors, 25+ research articles, over 120,000 lines of code, rich category hierarchy, and more.
- Can be found at http://mupad-combinat.sourceforge.net/

# Sage Days 7

- Nicolas Thiéry, Anne Schilling, and Jason Bandlow from MUPAD-COMBINAT attended and worked with others on implementing crystals in Sage.
- ► The project showed that the possiblity of porting MUPAD-COMBINAT to Sage was feasible.
- Since Sage Days 7, there has been continued interaction between the two projects resulting a fair amount of code being produced for Sage.

## Development Model

#### Requirements

- 1. Make it easy for developers to share and work collaboratively on unfinshed code.
- 2. Make it easy to move finished code into the Sage library.

3 N

## Development Model

#### Mercurial Queue Patch Repository

- ▶ We develop patches that apply on top of the Sage library.
- It is easy to apply, unapply, and edit any of the patches.
- ▶ It is easy to migrate patches across Sage releases.
- When a patch or series of patches are ready, they are sent off to the Sage trac server.
- When they are merged, we mark them as merged so they can be "removed" from our repository when the next Sage is released.

# **Combinatorial Species**

伺 ト く ヨ ト く ヨ ト

3

#### What are species?

Species include trees, graphs, functions, relations, permutations, cycles, lists, lattices, posets, automata, finite geometries, finite groups, ...

The theory of species is a theoretical framework concerned with enumerating these types of objects. Google has very generously funded me to work on implementing combinatorial species in Sage this summer. What are species?

#### More specifically...

Let  ${\mathbb B}$  be the category of finite sets with bijections. A species is simply a functor

$$F:\mathbb{B}\to\mathbb{B}.$$

More specifically...

► For every finite set A, we get a finite set F[A] whose elements are said to be the *structures* of F on the underlying set A.

## More specifically...

• For each bijection  $\phi : A \rightarrow B$ , we have a bijection

```
F[\phi]:F[A]\to F[B]
```

which is called the transport of *F*-structures along  $\phi$ .

## More specifically...

#### ▶ F is *functorial*, which means that

1. 
$$F[Id_A] = Id_{F[A]}$$
  
2.  $F[\psi\phi] = F[\psi]F[\phi]$ .

æ

伺 ト イヨト イヨト

## Generating Series

To each species F, we associate the (exponential) generating series

$$F(x) = \sum_{n \ge 0} f_n \frac{x^n}{n!}$$

where  $f_n$  is the number of elements of F[A] for any A with n elements.

4 B K 4 B K

# Isomorphism Type Generating Series

We say that two elements  $s, t \in F[A]$  are isomorphic if there exists a bijection  $\phi : A \rightarrow A$  such that

 $F[\phi](s) = t.$ 

The isomorphism type generating series of F is defined to be

$$\tilde{F}(x) = \sum_{n \ge 0} \tilde{f}_n x^n$$

where  $\tilde{f}_n$  is the number of non-isomorphic elements of F[A] for any A with n elements.

## **Example:** Partition Species

We define the species of partitions P by letting P[A] be all set partitions of A. Then,

$$P(x) = \sum_{n \ge 0} B_n \frac{x^n}{n!}$$

and

$$\tilde{P}(x) = \sum_{n \ge 0} p_n x^n$$

where  $B_n$  are the Bell numbers and  $p_n$  is the number of integer partitions of n.

. . . . . . .

#### Operations on species

#### Addition

$$(F+G)[A] = F[A] + G[A]$$

The sum on the right side corresponds to a disjoint union.

A B > A B >

## Operations on species

#### Multiplication

$$(F \cdot G)[A] = \sum_{B+C=A} F[B] \times G[C]$$

э

-

### Operations on species

Composition When  $G[\emptyset] = \emptyset$ ,

$$(F \circ G)[A] = \sum_{\pi \in P[A]} F[\pi] imes \prod_{B \in \pi} G[B]$$

э

< ∃ →

## Recursive definition

"A rooted tree is a root which is attached to a set of rooted trees."

$$A = X \cdot E(A)$$

< ∃ →

## ALDOR-COMBINAT

- Started in 2006 by Ralf Hemmecke and Martin Rubey.
- Written as a fully literate program in the language of Aldor that tries to stay as close as possible to the theory of species as outlined in BLL.
- Can be found at http://www.risc.unilinz.ac.at/people/hemmecke/aldor/combinat/

My initial work has been to port  $\operatorname{ALDOR-COMBINAT}$  to Sage/Python.

 $\begin{array}{c} {\rm SAGE-COMBINAT}\\ {\rm Combinatorial \ Species} \end{array}$

## Future Work

Later today, I will post my code as a public patch repository.

- Random element generation
- Lazy Karatsuba product
- Finding a recurrence
- Weighted species
- Multisort species
- Tensorial species
